COLOR THEORY

Presented by: Nathan Ramos 从孝

Mere color can speak to the soul in a thousand different ways

-Oscar Wilde

People decide whether or not they like a product in 90 seconds or less. 90% of that decision is based solely on color.

What is color theory?

Color theory is both the science and art of using color. It explains how humans perceive color; and the visual effects of how colors mix, match or contrast with each other. Color theory also involves the messages colors communicate; and the methods used to replicate color.

Color Emotion Guide

In color theory, a color scheme is the choice of colors used in design for a range of media. For example, the "Achromatic" use of a white background with black text is an example of a basic and commonly default color scheme in web design.

Color schemes are used to create style and appeal. Colors that create an aesthetic feeling when used together will commonly accompany each other in color schemes. A basic color scheme will use two colors that look appealing together.

Types of color schemes

- Monochromatic
- Analogous Palette
- Complementary
- Split Complementary
- Triadic Complementary
- Tetradic (Double Complementary)
- Tetradic (Double Split Complementary)
- Warm and Cool Colors

Monochromatic

Monochromatic color schemes are all of a single tint, shade, and hue. Because they lack definition or focal areas, they tend to be relaxing. They are really easy to manage, as there are no more decisions to be made concerning color.

Monochromatic

Analogous Palette

This palette uses harmonizing colors, either in the warm or cool spectrum. For instance, red-orange-yellow combinations or green-blue-violet are more appealing than violet-green-orange. Again there are exceptions. Try not to use too many analogous colors because it will ruin the flow of the area.

Analogous Palette

Complementary

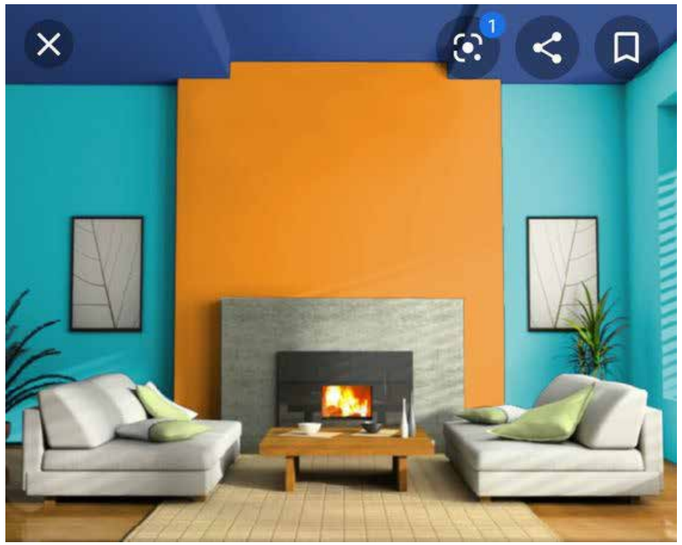

Complementary colors are two colors that are on opposite sides of the color wheel. As an artist, knowing which colors are complementary to one another can help you make good color decisions.

Complementary

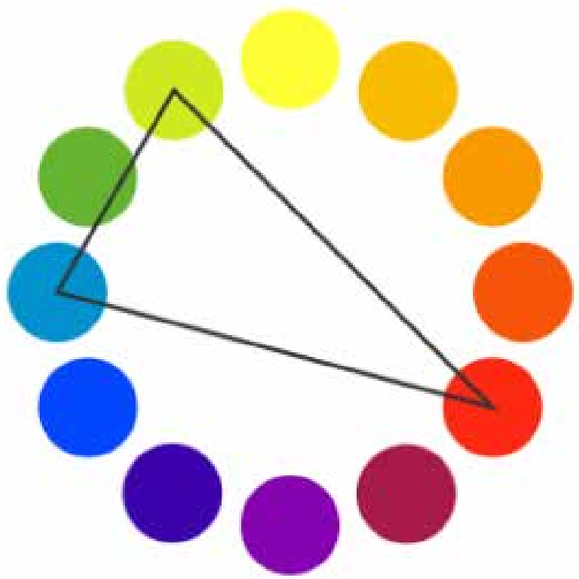

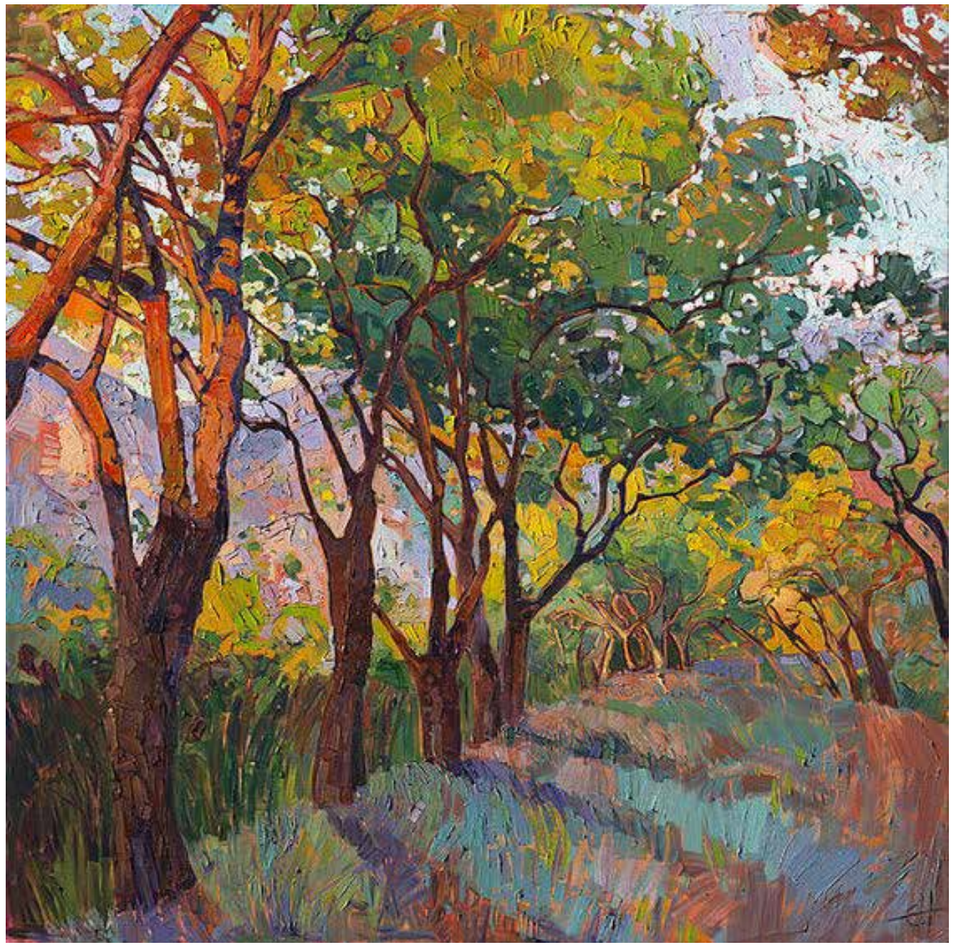

Split Complementary

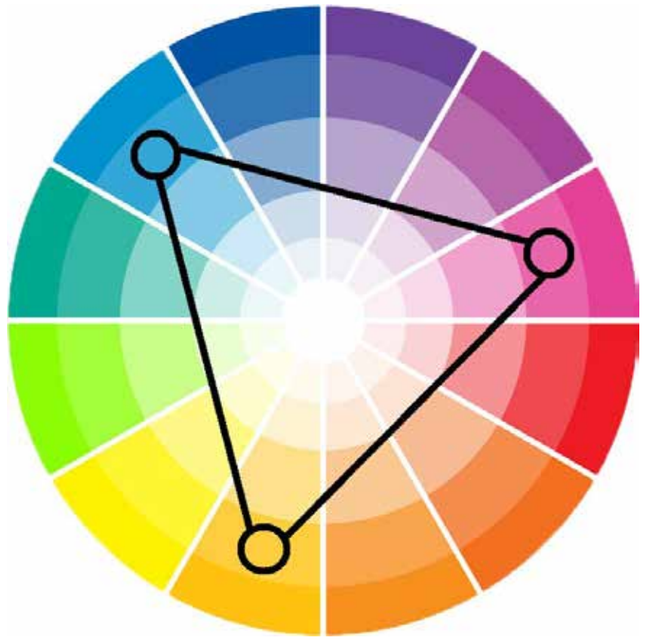

On the color wheel, these are exact opposites. Red's opposite is green. Violet's nemesis is yellow, and the anti-blue is orange. Here is where it gets difficult, so I'll break it down. 1. Choose a color (I'll choose blue). 2. Find its complimentary (orange). 3. Now choose colors on either side of orange on the color wheel (yellow-orange and red-orange).

Split Complementary

Triadic Complementary

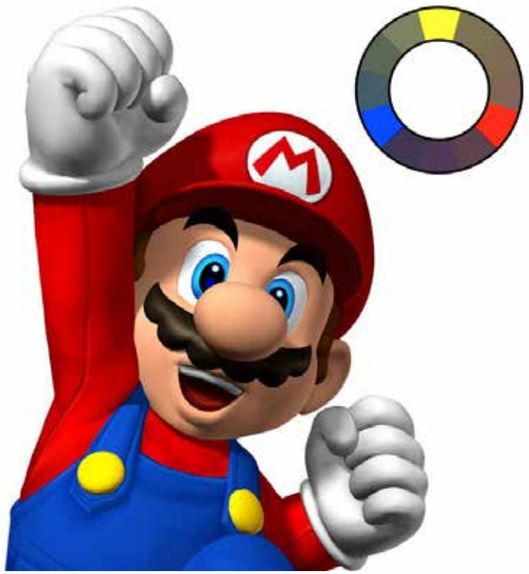

Have you ever played cat's cradle with a piece of string? Working with a triad complementary color scheme is kind of like that. It looks easy if you know what you're doing. If you don't, you just end up with a mess. The fundamental idea is that you take three colors which are evenly spaced around the color wheel.

Triadic Complementary

Tetradic (Double Complementary)

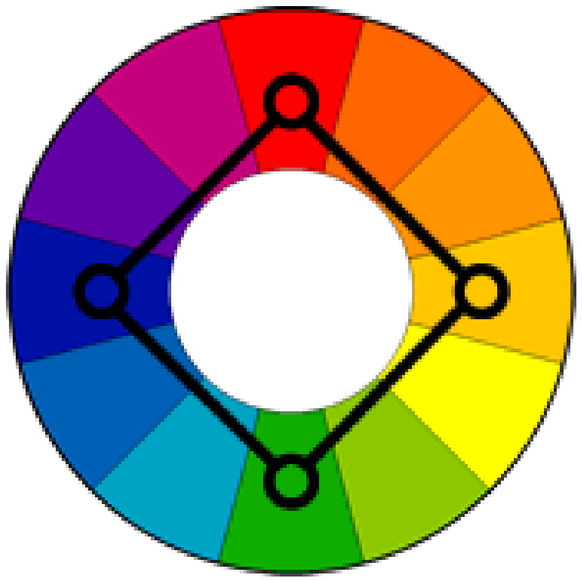

A tetrad is a color scheme, a special variant of the dual color scheme, with the equal distance between all colors. All four colors are distributed evenly around the color wheel, causing there is no clear dominance of one color.

Tetradic (Double Complementary)

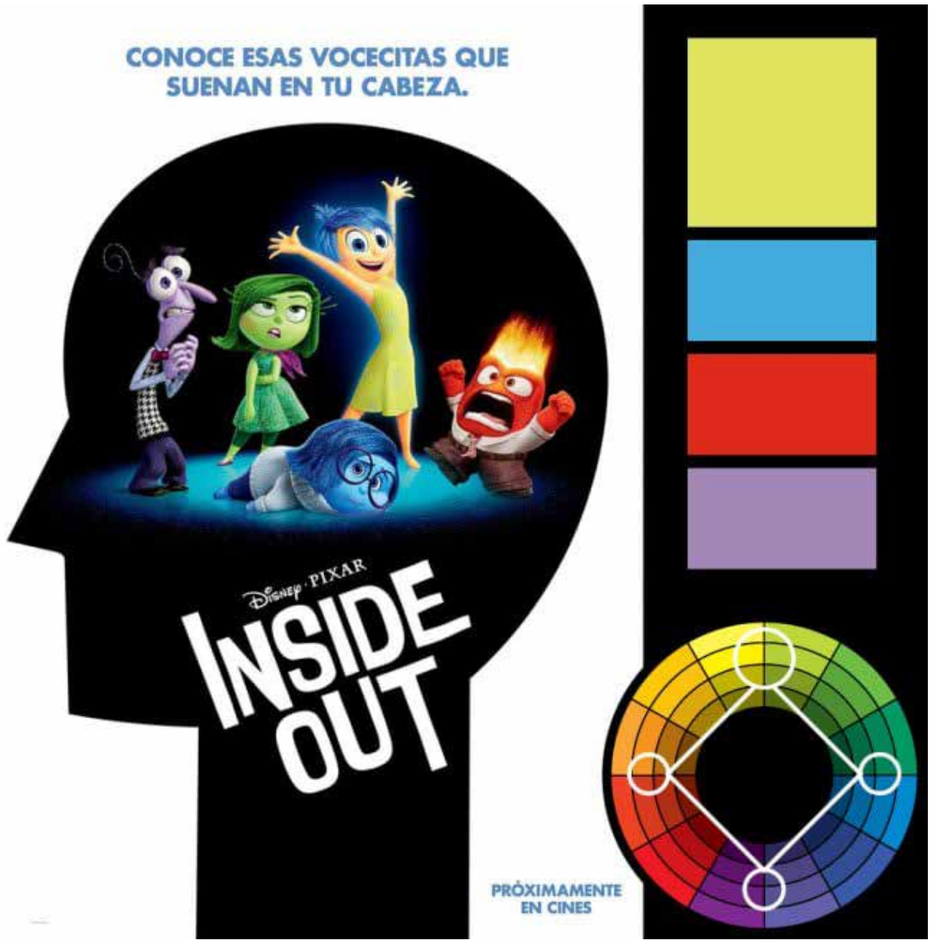

Double Split Complementary

Double-split complementary color schemes are commonly used in the fashion industry. This complex scheme provides a lot of contrast in color while still blending harmoniously. An example of a double-split complementary scheme is red, orange, green and blue.

Double Split Complementary

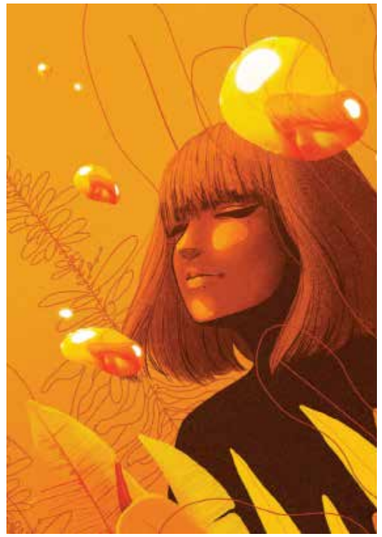

Warm Colors

Warm colors are generally associated with energy, brightness, and action.

Warm Colors

Cool Colors

Cool colors are often identified with calm, peace, and serenity.

When you recognize that color has a temperature, you can understand how choosing all warm or all cool colors in a logo or on your website can impact your message.

Cool Colors

Hue, shade, tint and tone

Let's go back to that 64-pack of crayons from our first day of school. (Remember "raw umber"? What is an umber anyway, and is it actually better raw than cooked?) Anyway, you might be wondering, how we got from the twelve colors on our original color wheel to all those crayons? That's where tints, shades, and tones come in.

Let's go back to that 64-pack of crayons from our first day of school. (Remember "raw umber"? What is an umber anyway, and is it actually better raw than cooked?) Anyway, you might be wondering, how we got from the twelve colors on our original color wheel to all those crayons? That's where tints, shades, and tones come in.

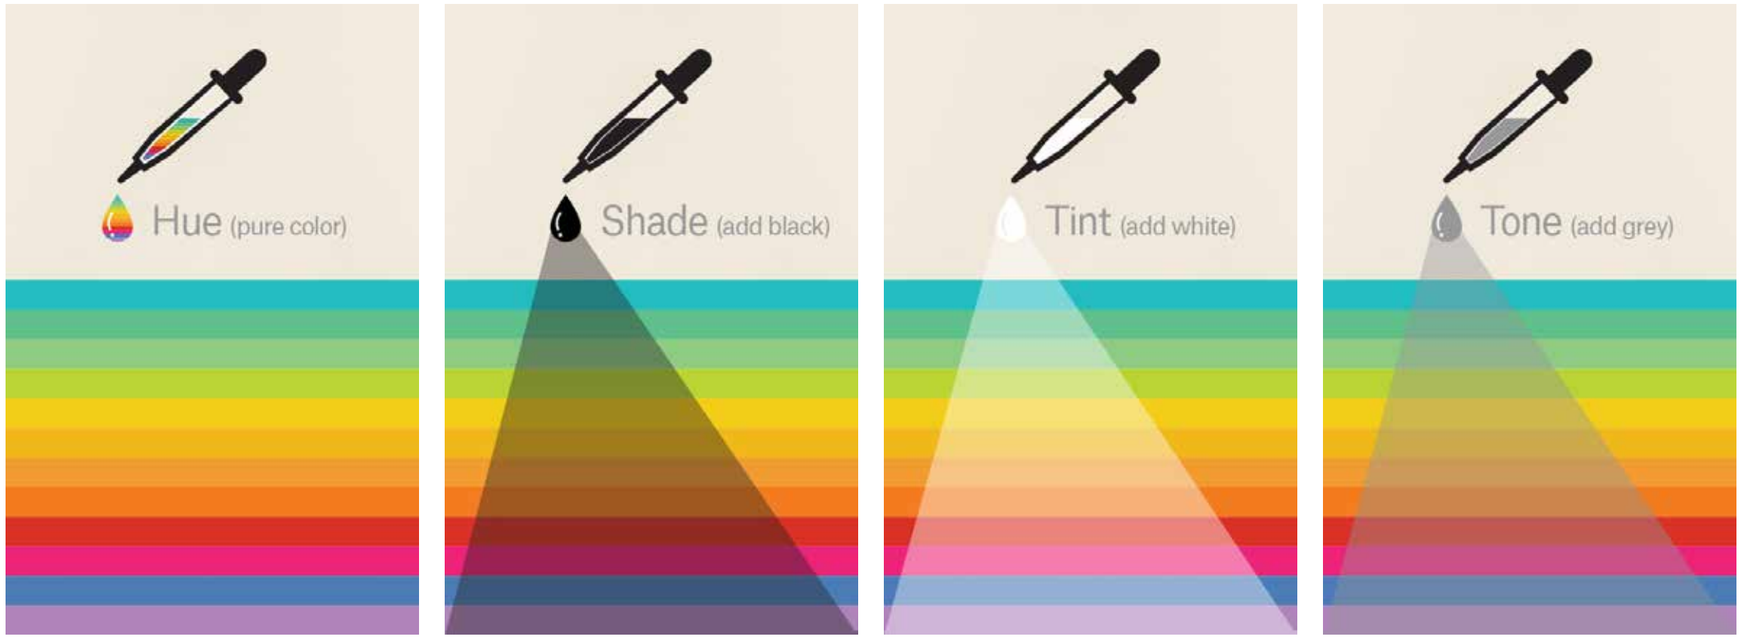

Hue, shade, tint and tone

Simply put, tints, tones and shades are variations of hues, or colors, on the color wheel. A tint is a hue to which white has been added. For example, red + white = pink. A shade is a hue to which black has been added. For example, red + black = burgundy. Finally, a tone is a color to which black and white (or grey) have been added. This darkens the original hue while making the color appear more subtle and less intense.
